Clastic rocks are composed of fragments, or clasts, of pre-existing minerals and rock. A clast is a fragment of geological detritus, chunks and smaller grains of rock broken off other rocks by physical weathering. Geologists use the term clastic with reference to sedimentary rocks as well as to particles in sediment transport whether in suspension or as bed load, and in sediment deposits.

differences between plutonic and volcanic rocks are more complex and more revealing of the geological evolution of the earth. Thus, a representative plutonic rock would be granite, while representative in turn of volcanic rock would be basalt. Besides the difference between the large crystals of the former and the microscopic crystals of the latter, they contrast markedly in color.

Example: Sands in the Gulf of Mexico A modern example serves well to show how studies of heavy minerals could help to determine the source of sands in ancient rocks. Sands in the Gulf of Mexico can be divided into 5 provinces based on their source, which of course is known for modern sands since we can trace the streams draining into the Gulf back to the areas that they drain.
